Financial Econometrics Practice TS #2 (Forecasting)

Daniel Campos, Joshua Castillo, & Cherryl Chico; February 22, 2026

1 Load Packages and Data

```r
library(forecast)
```

```
## Warning: package 'forecast' was built under R version 4.5.2
```

```r
library(tseries)
```

```
## Warning: package 'tseries' was built under R version 4.5.2

## Registered S3 method overwritten by 'quantmod':
##   method            from
##   as.zoo.data.frame zoo
```

```r
library(lmtest)
```

```
## Loading required package: zoo

## Warning: package 'zoo' was built under R version 4.5.2

##
## Attaching package: 'zoo'

## The following objects are masked from 'package:base':
##
##     as.Date, as.Date.numeric
```

```r
library(nortest)
library(MASS)
```

Read the data as a time series object. The data is the number of individuals registered as unemployed in SEPE offices since January 2000 available at https://expinterweb.mites.gob.es/series/. Select window starting 2000.

```r
series <- window(
  ts(read.table("unemploy.dat", dec = ",") / 1e6,
     start = 1996, freq = 12),
  start = c(2000),
  end = c(2025, 12)
)

# Display properties
cat("Class:", class(series), "\n")
```

```
## Class: ts
```

```r
cat("Length:", length(series), "observations\n")
```

```
## Length: 312 observations
```

```r
cat("Start:", start(series)[1], "Period", start(series)[2], "\n")
```

```
## Start: 2000 Period 1
```

```r
cat("End:", end(series)[1], "Period", end(series)[2], "\n")
```

```
## End: 2025 Period 12
```

```r
cat("Frequency:", frequency(series), "\n\n")
```

```
## Frequency: 12
```

```r
# show values
round(series, 3)
```

```

```

```r
# constants
series_name <- "Unemployment Rate"
start_year <- 2000
start_period <- 1
freq <- 12
period_length <- 12
xlabel <- "month"
ylabel <- "unemployment rate"
```

some obvious yearly seasonality, but SARIMA will handle that

```r
plot(series, main=series_name, xlab=xlabel, ylab=ylabel)
abline(v=1996:2026,col=4,lty=3)
```

To model, we first achieve variance constancy and let SARIMA handle the seasonality and mean stability.

2 Transformation to Variance Constancy

use rolling window stdev better than boxplot, with heteroskedasticity

```
#function to plot rolling standard deviation
plot_rolling_std <- function(series, window_size, name="Series") {
  rolling_std <- sapply(1:(length(series) - window_size + 1), function(i) {
    sd(series[i:(i + window_size - 1)])
  })

  plot(rolling_std, type = "l",
    main = paste(name, "\nRolling Standard Deviation (",
           window_size, "-month window)", sep = ""),
    xlab = "Time", ylab = "Standard Deviation")
  abline(h=mean(rolling_std), col=2, lwd=2)
}
```

2.1 Rolling standard deviation

```
plot_rolling_std(series, 12, series_name)
```

##

LN Transformation seemed to handle mean stability and seasonality

```
ln_transformed <- log(series / 100)
plot(ln_transformed, type="o",
  main=paste(series_name, "(log transformed)"),
  ylab=paste("Log of Unemployment Rate (%)", sep=""),
  xlab="")
abline(h=mean(ln_transformed), col=2, lwd=2)
```

still with obvious heteroskedasticity here

```
plot_rolling_std(ln_transformed, 12, paste(series_name, "(log transformed)"))
```

##

Box Cox Transformation

```
# Box-Cox transformation to find optimal lambda for variance stabilization
boxcox_result <- boxcox(series ~ 1, lambda = seq(-2, 2, by = 0.1))
```

```r
optimal_lambda <- boxcox_result$x[which.max(boxcox_result$y)]
cat("Optimal lambda for Box-Cox transformation:", optimal_lambda, "\n")
```

```
## Optimal lambda for Box-Cox transformation: -0.02020202
```

```r
# Apply Box-Cox transformation with optimal lambda
bc_transformed <- (series^optimal_lambda - 1) / optimal_lambda
```

```r
plot(bc_transformed, type="o",
  main=paste(series_name, "(Box-Cox transformed)"),
  ylab=paste("Box-Cox transformed Unemployment Rate (%)", sep=""),
  xlab="")
abline(h=mean(bc_transformed), col=2, lwd=2)
```

plot

```r
plot_rolling_std(bc_transformed, 12, paste(series_name, "(Box-Cox transformed)"))
```

plot all three transformations together for comparison

```
par(mfrow=c(3,1))
plot_rolling_std(series, 12, paste(series_name, "(Original)"))
plot_rolling_std(bc_transformed, 12, paste(series_name, "(Box-Cox transformed)"))
plot_rolling_std(ln_transformed, 12, paste(series_name, "(log transformed)"))
```

#

Prep for SARIMA

```
par(mfrow=c(1,1))
working_series <- ln_transformed
working_series_name <- paste(series_name, "(log transformed)")
ylabel <- paste("Log of", series_name, "(%)", sep="")
plot(working_series, type="o", main=working_series_name, ylab=ylabel, xlab=xlabel)
```

ACF

PACF to see potential sarima models

definitely need differencing

```
par(mfrow=c(1,2))
acf(working_series, ylim=c(-1,1), lag.max=max(60, 3*freq),
    lwd=2, main=paste("ACF:", working_series_name),
)
pacf(working_series, ylim=c(-1,1), lag.max=max(60, 3*freq),
     lwd=2, main=paste("PACF:", working_series_name),
     col=c(2, rep(1, 59)))
```

```
par(mfrow=c(1,1))
```

Do first differencing to determine seasonality and ARMA structure

```
diff_series <- diff(working_series)
par(mfrow=c(1,2))
lag_limit <- max(60, 3*freq)
seasonal_lags <- seq(freq, lag_limit, by=freq)

acf_obj <- acf(diff_series, ylim=c(-1,1), lag.max=lag_limit,
         lwd=2, col=1, main=paste("ACF:", working_series_name, "(1st Diff)"))
acf_lags <- as.numeric(acf_obj$lag)[-1]
acf_vals <- as.numeric(acf_obj$acf)[-1]
acf_idx <- which(round(acf_lags * freq) %in% seasonal_lags)
segments(acf_lags[acf_idx], 0, acf_lags[acf_idx], acf_vals[acf_idx], col=2, lwd=2)
points(acf_lags[acf_idx], acf_vals[acf_idx], col=2, pch=16)

pacf_obj <- pacf(diff_series, ylim=c(-1,1), lag.max=lag_limit,
         lwd=2, col=1, main=paste("PACF:", working_series_name, "(1st Diff)"))
pacf_lags <- as.numeric(pacf_obj$lag)
pacf_vals <- as.numeric(pacf_obj$acf)
pacf_idx <- which(round(pacf_lags * freq) %in% seasonal_lags)
segments(pacf_lags[pacf_idx], 0, pacf_lags[pacf_idx], pacf_vals[pacf_idx], col=2, lwd=2)
points(pacf_lags[pacf_idx], pacf_vals[pacf_idx], col=2, pch=16)
```

We should do seasonality 12 for both AR and MA, and then up to AR(5) and MA(3) for the non-seasonal part, based on the ACF and PACF patterns.

```
working_series <- diff_series
```

3 SARIMA Modeling

3.1 SARIMA function

```
analyze_sarima <- function(series, order, seasonal) {

  # --- Setup ---
  s <- frequency(series)
  n <- length(series)
  model_name <- paste0("ARIMA(", paste(order, collapse=","), ")(",
                       paste(seasonal$order, collapse=","), ")", s)

  cat("\n==================================================================\n")
  cat("  ANALYSIS FOR MODEL:", model_name, "\n")
  cat("==================================================================\n")

  # ----------------------------------------------------------------------
  # 1. Estimation & Significance Check
  # ----------------------------------------------------------------------
  fit_full <- arima(series, order = order, seasonal = seasonal)

  diag_var <- diag(fit_full$var.coef)
  if (any(diag_var <= 0)) {
    cat("\n  CRITICAL WARNING: The Hessian matrix is unstable (Negative Variances).\n")
```

```r
  se_vec <- ifelse(diag_var > 0, sqrt(diag_var), NA)
} else {
  se_vec <- sqrt(diag_var)
}

t_vec  <- fit_full$coef / se_vec
p_vec  <- 2 * (1 - pnorm(abs(t_vec)))

coeftest <- data.frame(
  Estimate = fit_full$coef,
  Std.Error = se_vec,
  t_stat = t_vec,
  p_value = p_vec
)

coeftest$Significant <- ifelse(!is.na(coeftest$p_value) &
                                 (coeftest$p_value < 0.05 | abs(coeftest$t_stat) > 2),
                               "Yes", "No")

cat("\n[1] COEFFICIENT SIGNIFICANCE (Alpha = 0.05 or |t| > 2):\n")
print(round(coeftest[,1:4], 4))
cat("\nSignificance Flags:\n")
print(coeftest[,5, drop=FALSE])

# ----------------------------------------------------------------------
# 2. Residual Analysis (Diagnostics)
# ----------------------------------------------------------------------
resid <- residuals(fit_full)

4 Choosing Model

All modeels dont have normal residuals because of covid. Disregarding that, based on model performance we have models 13, 3, 6 but for parsimony were choosing the simplest which is ARIMA(1,0,2)(1,0,1)[12].
